Kapa Me.

About us.

1. Formation history.

1. Incorporator.

- MC BRAINSTORM (PTY) LTD.

2. Incorporation.

- November 29, 2022.

3. Founders.

1. Ahmed Manack.

4. Founded.

- The year 2022.

2. Vision.

- Our vision is to become a household brand synonymous with the transportation industry.

3. Mission.

- Our mission is to connect the transportation industry through a simple-to-use, free Google-based mobile application.

4. Aim.

- We aim to connect users to and within the transportation industry through a simple-to-use, free Google-based mobile application for the transportation sector.

5. Idea inception and idea enhancements.

- The rudimentary idea behind using a free Google-based mobile application to modernize South Africa's informal transportation sector was first conceived in 2014. The mobile application was initially meant to use hand signs to communicate between public drivers and public commuters using a mobile application. However, research demonstrated that the mobile application should use specific destination locations instead of hand signs. This allows general drivers and public commuters to communicate their destination locations more accurately through a simple-to-use online mobile application. Since then, other services, such as group, and item transportation-related quote services, have all been added to the online mobile application platform in a simple-to-use way.

  The draft mobile application process started in the year 2020. However, the final mobile application development process began in 2021 and is looking to be completed and fully operational by mid-year 2023.

6. The journey of bringing Kapa Me to life.

- The journey has been long and cumbersome. It began in 2014 with just a rudimentary idea. However, due to the need for more resources and networks. The idea was unable to get the traction it needed to take off. However, partnering with MC Brainstorm enabled us to overcome many such challenges. MC Brainstorm breathed new life into the project by acquiring the resources required to start the development. MC Brainstorm put together an extremely hardworking, knowledgeable group of highly talented and driven individuals to bring the idea to life, which is expected to be fully completed and operational by mid-year 2023. The project will reach the final stages of development at the end of 2022.

7. Top 5 problems identified and our aims to solve them.

1. Currently, the group transportation sector needs to use technological innovations. Research indicated that companies could not attain multiple group transportation service quotes on a free-to-use Google-based mobile application. Group transportation service providers can also not source and connect with customers needing such services on a free-to-use Google-based mobile application.

2. Currently, large and small item transportation companies need to use technological innovations. These companies could not attain quotes from large and small companies for large and small item transportation services on something other than a free-to-use Google-based mobile application. Large and small item transportation service providers can also not source and connect with customers needing such services on a free-to-use Google-based mobile application.

3. Currently, public drivers and commuters have yet to be able to use the innovations made in technology entirely. There is no free-to-use Google-based mobile application for public commuters and drivers to connect and network.

4. Currently, private drivers and commuters have yet to be able to use the innovations made in technology entirely. Private drivers and commuters are looking to supplement their fuel costs by searching for once-off or frequent carpooling services to specific destination locations. Find it increasingly time-consuming and tedious to locate private commuters or drivers going to their destination locations through a free-to-use Google-based mobile application.

5. There's no fee to use Google-based all-inclusive mobile transportation and networking application available for download.

8. Kapa Me description.

- Kapa Me is a transportation social networking application which aims to connect users to the transportation industry through a free online mobile application.

9. Kapa Me descriptions of services offered.

1. Group transport: Group transport users can request group transportation services online. Users will receive quotes from multiple group transportation service providers. This enables users to compare various quotes and profiles online before making decisions. Users can also connect and source specific group transportation service providers through the free-to-use Google-based mobile application.

2. Group transporter: Group transporter users can source, quote and connect to multiple potential customers online. Users can join and source customers with specific group transportation requests and requirements using a free Google-based mobile application.

3. Item transport: Item transport users can request item transportation services online. Users will receive quotes from multiple item transportation service providers. This enables the user to compare various quotes and profiles online before making decisions. Users can connect and source specific item transportation service providers through the free-to-use Google-based mobile application.

4. Item transporter: Item transporter users can source, quote and connect to multiple potential customers online. Users can join and source customers regarding specific item transportation requests and requirements using a free Google-based mobile application.

5. Private commuter users can source and connect with private drivers online. Private commuters searching for once-off or frequent transportation services can join and source personal transportation through an online application. Private commuters can compare offers and profiles of private drivers online before deciding. Users can also click and source private drivers for specific transportation services through the free-to-use Google-based mobile application.

6. Private driver: Private driver users can source and connect with private commuters online. Private drivers can connect with private commuters searching for once-off or frequent transportation services through an online application. Private drivers can compare offers and profiles of personal commutes online before deciding. Users can also connect and source private commuters needing specific transportation services through the free-to-use Google-based mobile application.

7. Public driver: Public driver users can source and connect with public commuters online through a free Google-based mobile application.

8. Public commuter: Public commuter users can source and connect with general drivers online through a free Google-based mobile application.

10. Kapa Me future.

1. Kapa Me plans to add more transportation services to the transportation services it intends to provide on its free Google-based mobile application.

2. Kapa Me plans to add additional safety features to the free Google-based mobile application.

3. Kapa Me plans to continuously enhance the user experience on the free Google-based mobile application through regular updates on all platforms.

4. Kapa me plans to change the transportation industry for the individuals needing specific transportation services and the companies offering that particular transportation service. Both parties have more opportunities to connect and network online through a free Google-based mobile application.

5. Kapa Me plans to add subscription-based services to the free Google-based mobile application for specific users.

6. Kapa Me plans to add user-specific transportation features to the free Google-based mobile application specific to each user.
